iNeuron

Project Title	Generation of Face Images from Sketches
Technologies	Deep Learning (GAN)
Domain	Security and Safety
Project Difficulties level	Intermediate

Problem Statement:

In the field of public security systems, most local surveillance systems are not perfect, so police officers are often unable to obtain high-quality, complete color images of suspects which often leads to police unable to confirm the identity of the suspect by comparing them with database images. In response to this situation, the police can only compare the image of the database with the witness's sketch image of the suspect, but the image comparison success rate is extremely low due to the huge difference between the sketch image and the color image. It has brought great difficulties to the arrest of criminal suspects. In this case, the study of the translation of the face sketch image to a color image has greatly helped the police to confirm the identity of the suspect. In the field of digital entertainment, many people want to have software, which can convert their own sketches into color images while transforming their hair color or skin color into their favorite color. In those cases, a method is necessary, which not only can generate high-quality reconstructed image from sketch to image translation, but also can control the facial attribute changing during the sketch to image translation.

The main objective here is -

1. Synthesizing realistic images from human drawn sketches.

2. Can control the facial attribute changing during the sketch to image translation

3. Compare the image of the database with the witness's sketch image of the suspect.

Dataset:

You have to collect your dataset for this project from different sources and based on that, you have to design your solution and create a repo for the dataset.

Project Evaluation metrics:

Code:

- You are supposed to write a code in a modular fashion
- Safe: It can be used without causing harm.
- Testable: It can be tested at the code level.
- Maintainable: It can be maintained, even as your codebase grows.
- Portable: It works the same in every environment (operating system)
- You have to maintain your code on GitHub.
- You have to keep your GitHub repo public so that anyone can check your code.
- Proper readme file you have to maintain for any project development.
- You should include basic workflow and execution of the entire project in the readme file on GitHub
- Follow the coding standards: https://www.python.org/dev/peps/pep-0008/

Database:

- You are supposed to use a given dataset for this project which is a Cassandra database.
- https://astra.dev/ineuron

Cloud:

- You can use any cloud platform for this entire solution hosting like AWS, Azure or GCP

API Details or User Interface:

- You have to expose your complete solution as an API or try to create a user interface for your model testing. Anything will be fine for us.

Logging:

Click here to enter text.

- Logging is a must for every action performed by your code use the python logging library for this.

Ops Pipeline:

- If possible, you can try to use AI ops pipeline for project delivery Ex. DVC, MLflow , Sagemaker , Azure machine learning studio, Jenkins, Circle CI, Azure DevOps , TFX, Travis CI

Deployment:

- You can host your model in the cloud platform, edge devices, or maybe local, but with a proper justification of your system design.

Solutions Design:

- You have to submit complete solution design strategies in HLD and LLD document

System Architecture:

- You have to submit a system architecture design in your wireframe document and architecture document.

Latency for model response:

- You have to measure the response time of your model for a particular input of a dataset.

Optimization of solutions:

- Try to optimize your solution on code level, architecture level and mention all of these things in your final submission.
- Mention your test cases for your project.

Submission requirements:

Click here to enter text.

High-level Document:

You have to create a high-level document design for your project. You can reference the HLD form below the link.

Sample link:

HLD Document Link

Low-level document:

You have to create a Low-level document design for your project; you can refer to the LLD from the below link.

Sample link

LLD Document Link

Architecture: You have to create an Architecture document design for your project; you can refer to the Architecture from the below link.

Sample link

Architecture sample link

Wireframe: You have to create a Wireframe document design for your project; refer to the Wireframe from the below link.

Demo link

Wireframe Document Link

Project code:

You have to submit your code GitHub repo in your dashboard when the final submission of your project.

Demo link

Project code sample link :

Detail project report:

Click here to enter text.

You have to create a detailed project report and submit that document as per the given sample.

Demo link

DPR sample link

Project demo video:

You have to record a project demo video for at least 5 Minutes and submit that link as per the given demo.

Demo link

Project sample link :

The project LinkedIn a post:

You have to post your project detail on LinkedIn and submit that post link in your dashboard in your respective field.

Demo link

Linkedin post sample link :
